<u>CSCE 463/612</u> <u>Networks and Distributed Processing</u> <u>Spring 2024</u>

Transport Layer V

Dmitri Loguinov Texas A&M University

March 8, 2024

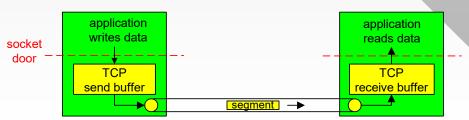

Chapter 3: Roadmap

- 3.1 Transport-layer services
- 3.2 Multiplexing and demultiplexing
- 3.3 Connectionless transport: UDP
- 3.4 Principles of reliable data transfer
- 3.5 Connection-oriented transport: TCP
 - Segment structure
 - Reliable data transfer
 - Flow control
 - Connection management

3.6 Principles of congestion control3.7 TCP congestion control

<u>TCP: Overview</u> [RFCs: 793, 1122, 1323, 2001, 2018, 2581, 3390, 5681]

- Point-to-point (unicast):
 - One sender, one receiver
- Reliable, in-order byte stream:
 - Packet boundaries are not visible to the application
- Pipelined:
 - TCP congestion and flow control set window size
- Send & receive buffers

- Full duplex data:
 - Bi-directional data flow in same connection
 - MSS: maximum segment size (excluding headers)
- Connection-oriented:
 - Handshaking (exchange of control msgs) initializes sender/receiver state before sending data
- Flow controlled:

socket

door

 Sender will not overwhelm receiver

Chapter 3: Roadmap

- 3.1 Transport-layer services
- 3.2 Multiplexing and demultiplexing
- 3.3 Connectionless transport: UDP
- 3.4 Principles of reliable data transfer
- 3.5 Connection-oriented transport: TCP
 - Segment structure
 - Reliable data transfer
 - Flow control
 - Connection management

3.6 Principles of congestion control3.7 TCP congestion control

TCP Segment Structure

32 bits

- Sequence/ACK numbers
 - Count bytes, not segments
 - ACKs piggybacked on data packets
- Flags (U-A-P-R-S-F)
 - Urgent data (not used)
 - ACK field is valid
 - PUSH (reduce latency)
 - RST (reset connection)
 - SYN (connection request)
 - FIN (connection close)
- Hdr length in DWORDs (4-bit field)
 - Normally 20 bytes, but longer if options are present

source port # dest port # sequence number acknowledgement number hdr not UAPRSF receiver window checksum Urg data pointer Options (variable length)

> application data (variable length)

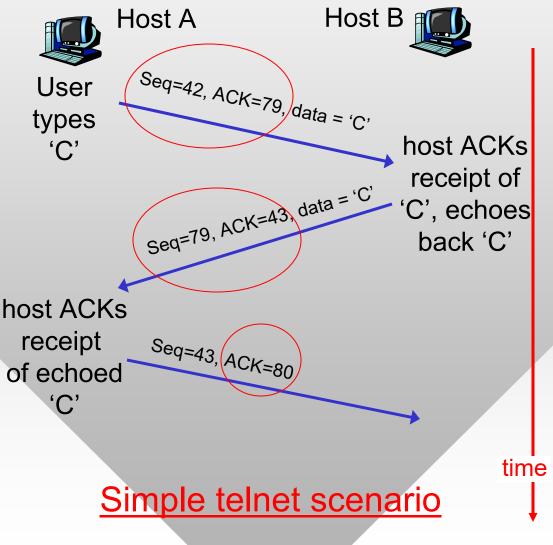

TCP Seq. #'S and ACKs

<u>Seq. #'s:</u>

 Sequence number of the first byte in segment's data

<u>ACKs:</u>

- Seq # of next byte expected from sender
- Cumulative ACK
- Q: how receiver handles out-oforder segments?
- A: TCP spec doesn't say, up to implementor

TCP Round Trip Time and Timeout

- Q: how to set TCP timeout value (RTO)?
- Want it slightly larger than the next RTT
 - But the RTT varies
- Too short: premature timeout
 - Unnecessary retransmissions
- Too long: slow reaction to segment loss
 - Protocol may stall, exhibit low performance

- <u>Idea</u>: dynamically measure RTT, average these samples, then add safety margin
- SampleRTT: measured time from segment transmission until ACK receipt
 - Ignore retransmissions, why?
- SampleRTT will vary, want estimated RTT "smoother"
 - Average several recent measurements, not just current SampleRTT

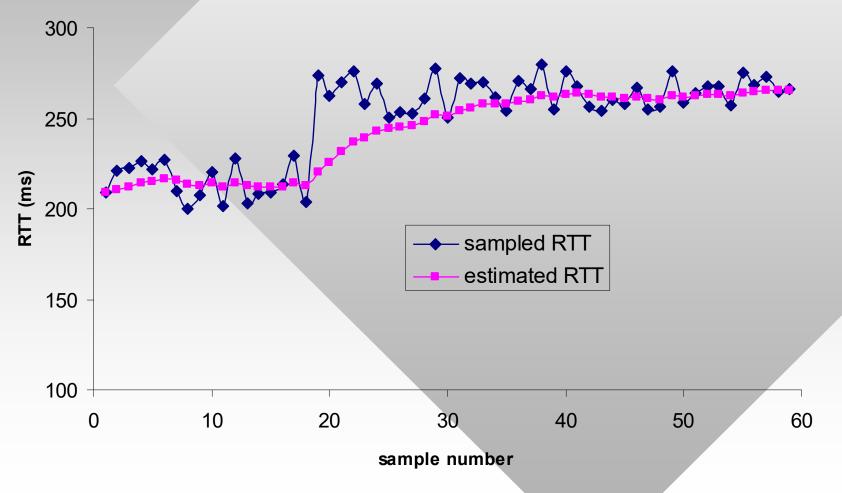

TCP Round Trip Time and Timeout

 $\texttt{EstimatedRTT}(n) = (1-\alpha) * \texttt{EstimatedRTT}(n-1) + \alpha * \texttt{SampleRTT}(n)$

- Exponentially weighted moving average (EWMA)
 - Influence of past sample decreases exponentially fast
 - Typical value: $\alpha = 1/8$
- Task: derive a non-recursive formula for EstimatedRTT(n)
 - Assume EstimatedRTT(0) = SampleRTT(0)
 - Let Y(n) = EstimatedRTT(n) and y(n) = SampleRTT(n)

$$Y(n) = (1 - \alpha)^n y(0) + \alpha \sum_{i=0}^{n-1} (1 - \alpha)^i y(n - i)$$

Example RTT Estimation:

9

TCP Round Trip Time and Timeout

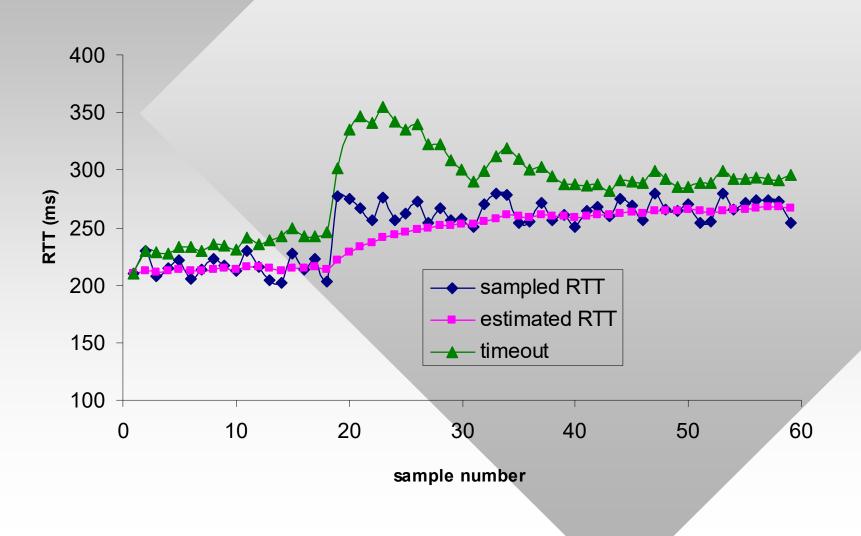

- Setting the timeout:
- EstimatedRTT plus a "safety margin"
 - Larger variation in EstimatedRTT → larger safety margin
- First estimate how much SampleRTT deviates from EstimatedRTT (typically, $\beta = 1/4$):

 $DevRTT(n) = (1-\beta)*DevRTT(n-1) + \beta*|SampleRTT(n)-EstimatedRTT(n)|$

Then set retransmission timeout (RTO):

RTO(n) = EstimatedRTT(n) + 4*DevRTT(n)

Example Timeout Estimation:

11
